Software Architecture

An Architectural Programming Language: JAVA/A An Algebraic Component Model

Software Architecture

Structuring elements

- components as building blocks
- connectors as glue
- ports for communication

Development process

- "[...] a component is modeled throughout the development life cycle [...]" (*UML 2.0 Superstructure Specification*)
- preservation and refinement of components

・ロト ・ 四 ト ・ 回 ト ・ 回 ト

Software Architecture in Development Processes

Analysis and Design

Architectural Description Languages: Wright, Darwin, Rapide, SARA, etc.

Implementation

- various component models (SOFA, EJB, ...)
- **but**: Programming languages do not reflect components
- danger of architectural erosion
- ⇒ integrate architectural concepts into programming languages: Architectural Programming

イロト イヨト イヨト イヨト

Architectural Programming (I)

Architectural Programming Languages (APLs)

 integrate components, ports, connectors and configurations as primitive language constructs

APLs should support

- strong encapsulation (communication exclusively via ports)
- ports with provided, required interfaces and protocols
- connectors for building up configurations
- runtime reconfiguration

イロト イヨト イヨト イヨト

Software Architecture

An Architectural Programming Language: JAVA/A An Algebraic Component Model

Architectural Programming (II)

Advantages of Architectural Programming

- maintainability
- reusability, replaceability and independent deployment
- seamless transition from model to code
- **separation** of application code and glue code

Architectural Programming (III)

Our approach

Architectural programming language JAVA/A

Implementable Component Models

- SOFA, Fractal:
 - support for software architectures
 - not programming languages: architectural erosion
- EJB, JavaBeans, COM+, etc.
 - no support for software architectures
 - component models without ports, etc.
 - here also: architectural erosion

Other APL

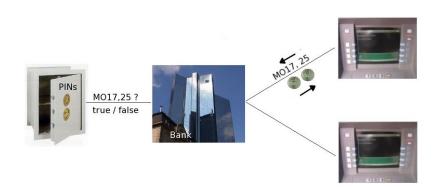

ArchJava (D. Notkin et al., University of Washington)

Comparison of ArchJava and JAVA/A

	components	ports	configurations	encapsulation
JAVA/A	yes	yes	explicit	yes
ArchJava	yes	yes	implicit	partial

	behavioural modeling	distributed applications	asynchronous communication
JAVA/A	yes	yes	yes
ArchJava	no	no	no

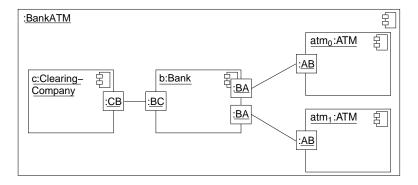

Example Bank–ATM (informal)

Example Bank–ATM: UML 2.0 Component Diagram

Example Bank-ATM: UML 2.0 Component Diagram

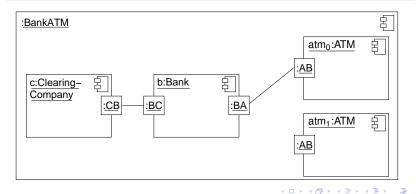

・ロ・ ・ 四・ ・ 回・ ・ 回・

Example Bank–ATM: Dynamic Reconfiguration

Connecting components on demand

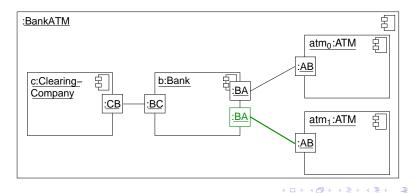

- ATMs are very often idle
- build up online connections only if necessary

Example Bank–ATM: Dynamic Reconfiguration

Connecting components on demand

- ATMs are very often idle
- build up online connections only if necessary

JAVA/A: An Architectural Programming Language (I)

Characteristics of JAVA/A

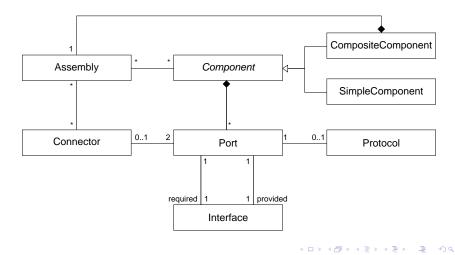

- components with ports (strong encapsulation)
- ports with provided and required interfaces, port protocols
- hierarchical composition
- reconfiguration at runtime
- loose coupling (independent deployment)
- model checking support for connectors (between ports)
- predefined connector types (local and distributed)

JAVA/A: An Architectural Programming Language (II)

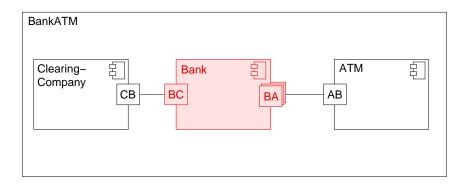

Current JAVA/A tool support

- compiler jaac
- Component Composition Platform (CCP):
 - building and editing configurations and components
- coordination and management framework
 - start and stop distributed applications

JAVA/A: Component Meta-Model

Example Bank–ATM: Implementation using JAVA/A

・ロ・ ・ 四・ ・ ヨ・ ・ 日・ ・

Example Bank–ATM: Implementation using JAVA/A

```
simple component Bank {
   Oueue pending = new LinkedList();
   BA current = null;
   Set verifieds = new HashSet();
   Map balance = new HashMap();
   dynamic port BA {
      provided {
          signal verifyPIN(IBAN iban, int pin);
          signal withdraw(IBAN iban, Money amount);
       }
      required {
          void pinOk(); void pinNotOk();
          void withdrawOk(); void withdrawNotOk();
       }
```

・ロト・(部・・モト・モ・・モ)

Example Bank–ATM: Implementation using JAVA/A

```
port BC {
    provided {
        void pinOk(); void pinNotOk();
    }
    required {
        void verifyPIN(IBAN iban, int pin);
    }
}
```

▲圖 ▶ ▲ 国 ▶ ▲ 国 ▶ →

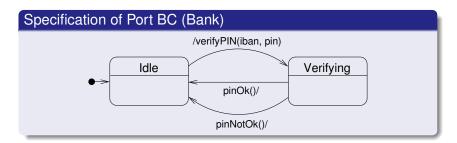

Example Bank–ATM: Implementation using JAVA/A

```
void pinOk() implements BC.pinOk() {
    verifieds.add(current);
    current.pinOk();
    current = null;
    // notification that current == null
}
```

(日) (圖) (E) (E) (E)

Specification of Port BC

• Ports are specified with UML 2.0 protocol state machines.

<ロ> <同> <同> < 同> < 同> < 同> 、

Example Bank–ATM: Configuration in JAVA/A

```
composite component BankATM {
   assembly {
      components { ATM, Bank, ClearingCompany }
      connectors { (ATM.AB, Bank.BA);
                    (Bank.BC, ClearingCompany.CB) }
      initial configuration {
          ATM atm0 = new ATM();
          ATM atml = new ATM();
          Bank bank = new Bank();
          ClearingCompany cc =
             new ClearingCompany();
          Connector cn0 = new Connector();
          cn0.connect(atm0.AB, bank.BA);
          Connector cn1 = new Connector();
          cnl.connect(atml.AB, bank.BA);
          Connector cn2 = new Connector();
          cn2.connect(bank.BC, cc.CB); } } }
```

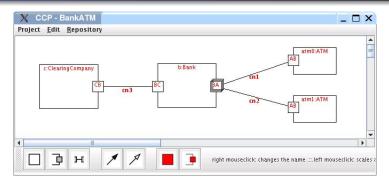

Example Bank–ATM: Reconfiguration in JAVA/A

try {

```
Component bank = componentLookUp(this, "Bank");
Port ba = bank.getPort("BA");
ConnectionRequest cr =
    new ConnectionRequest(this,
        this, AB, bank, ba, new Connector());
reconfigurationRequest(cr);
}
catch (ReconfigurationException e) {
    ...
}
```

Seamless Development

CCP: Component Composition Platform

- code generation
- round-trip engineering
- model checker integration for architectural analysis

A Model for AP: Overview (I)

Ports

- Signatures
 - provided interface $I = (\Sigma^{\text{pro}}, Op^{\text{pro}})$
 - required interface $O = (\Sigma^{req}, Op^{req})$
- Models: labelled transition systems
 - transitions: labelled by operation calls of provided and required operations op(v)/, /op(v)

A Model for AP: Overview (II)

Components

- Signatures
 - algebraic signature $\Sigma = (S, F)$ for internal states
 - port declarations of the form P : Σ_P
- Models: labelled transition systems
 - states: algebras over the internal state signature
 - transitions: labelled by operation calls on port instances
 p.op(v)/, /p.op(v)

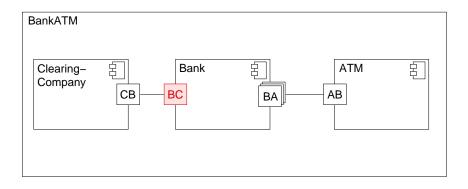

A Model for AP: Overview (III)

Assemblies

- Signatures
 - algebraic signature for internal state
 - component declarations of the form C : Σ_C
 - connector declarations of the form Con : Σ_{Con}
- Models: labelled transition systems
 - states: algebras over the internal state signature (of the assembly)
 - transitions: labelled by operation calls on port instances of component instances with synchronization on connected ports (c₁.p₁, c₂.p₂).op(v)

イロト イヨト イヨト イヨト

Example: Signature Σ_{BC} for Port BC (Bank)

Rolf Hennicker Architectural Programming

<ロ> <同> <同> < 同> < 同> < 同> 、

Example: Signature Σ_{BC} for Port BC (Bank)

Provided Interface IBC

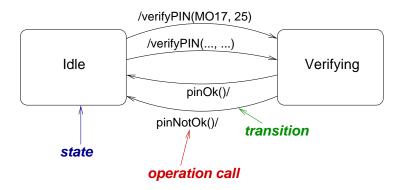

- sorts & funs: Ø
- operations: pinOk(), pinNotOk()

Required Interface O_{BC}

- sorts: int, IBAN
- funs: $\mathcal{F}_{int}, ...$
- operations: verifyPIN(iban: IBAN, pin: int)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ </p>

Example: A Model for Port BC (Bank)

Rolf Hennicker Architectural Programming

Example: Signature Σ_{Bank} for Component Bank

Port declarations

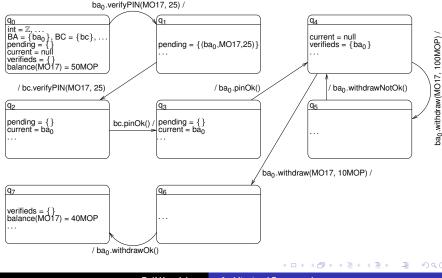

BA : Σ_{BA}, BC : Σ_{BC}

Internal signature Σ_{Banks}^{int}

- sorts: BA, BC, Queue, Set, Map, int, IBAN, Money
- funs: pending: \rightarrow Queue, current: \rightarrow BA, verifieds: \rightarrow Set, balance: \rightarrow Map, τ

```
\mathcal{F}_{	ext{int}},\ldots
```

Example: Part of a Model for Component Bank

Rolf Hennicker Architectural Programming

Relationship between Ports and Components

Component - Port

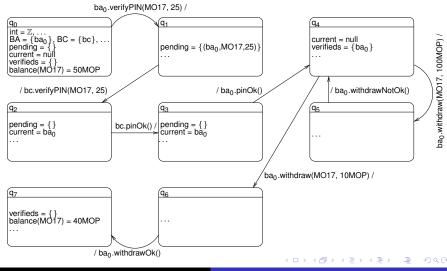

- a component has to implement all its ports
- ports can be dynamically created
- ports can be dynamically destroyed

Implementation Correctness

 reduction of a component model to a port instance must be a model of the port (up to observ. equiv.)

・ロト ・四ト ・ヨト ・ヨト

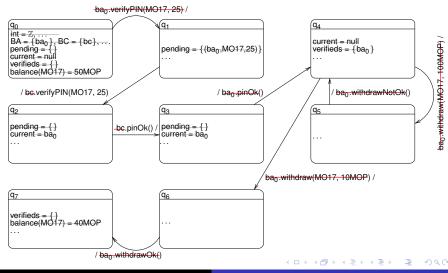

Reduct from the Model of Bank to Port Instance bc

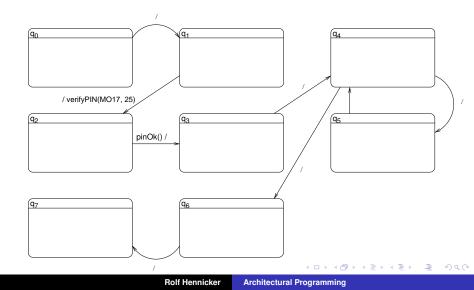

Reduct from the Model of Bank to Port Instance bc

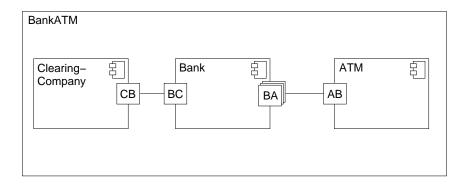

Reduct from the Model of Bank to Port Instance bc

Reduct from the Model of Bank to Port Instance bc

Example: Signature $\Sigma_{BankATM}$ for Assembly of Bank–ATM

Rolf Hennicker Architectural Programming

Example: Signature $\Sigma_{BankATM}$ for Assembly of Bank–ATM

Component Declarations

ATM : Σ_{ATM} , Bank : Σ_{Bank} , ClearingCompany : $\Sigma_{ClearingCompany}$

Connector Declarations

ABBA : (AB, BA), BCCB : (BC, CB)

Internal Signature

• sorts: ATM, Bank, ClearingCompany, AB, BA, BC, CB, ABBA, BCCB,...

 funs: pending: Bank → Queue, current: Bank → BA, verifieds: Bank → Set, balance: Bank → Map,...

Example: Part of a Model for Assembly of Bank–ATM (I)

Component instances

 $ATM = \{atm_0, atm_1\}, Bank = \{b\}, ClearingCompany = \{c\}$

Port instances

$$\begin{array}{l} \mathsf{AB}(atm_0) = \{ab_0\}, \, \mathsf{AB}(atm_1) = \{ab_1\}, \\ \mathsf{BA}(b) = \{ba_0, \, ba_1\}, \, \mathsf{BC}(b) = \{bc\}, \, \mathsf{CB}(b) = \{cb\} \end{array}$$

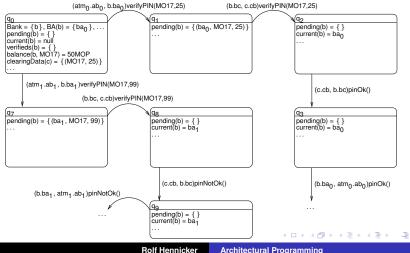

Connector instances

 $\mathsf{ABBA} = \{(ab_0, ba_0), (ab_1, ba_1)\}, \, \mathsf{BCCB} = \{(bc, \, cb)\}$

・ロ・ ・ 四・ ・ ヨ・ ・ 日・ ・

Example: Part of a Model for Assembly of Bank-ATM (II)

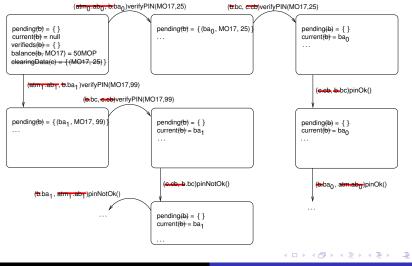

Rolf Hennicker

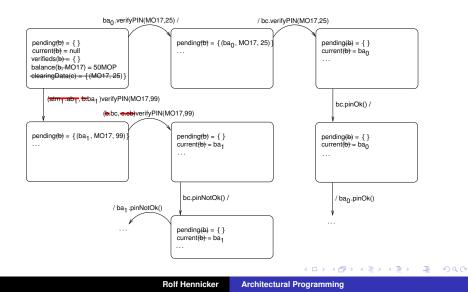

Reduct from Model Bank–ATM to Component b

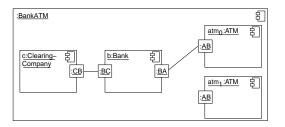

Reduct from Model Bank–ATM to Component b

Reduct from Model Bank–ATM to Component b

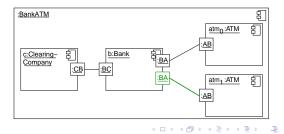

Example Bank–ATM: Reconfiguration

 $\begin{array}{l} \text{Port instances:} \\ AB(atm_0) = \{ab_0\}, \\ AB(atm_1) = \{ab_1\}, \\ BA(b) = \{ba_0\} \\ \text{Connector instances:} \\ ABBA = \{(ab_0, ba_0)\} \end{array}$

 $\begin{array}{l} \text{Port instances:} \\ AB(atm_0) = \{ab_0\}, \\ AB(atm_1) = \{ab_1\}, \\ BA(b) = \{ba_0, ba_1\} \\ \text{Connector instances:} \\ ABBA = \{(ab_0, ba_0), \\ (ab_1, ba_1)\} \end{array}$

Checking Connectors for JAVA/A

What is checked?

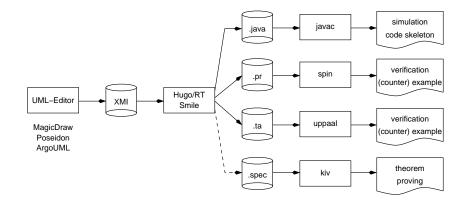

- Syntactically: interface conformance
- Semantically: absence of deadlocks

How is it checked?

- interface conformance: by the compiler
- absence of deadlocks: model checking using Hugo/RT
 - for finite state systems only ...

・ロト ・ 四 ト ・ 回 ト ・ 回 ト

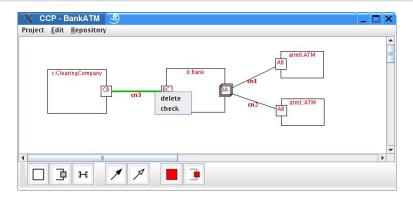

Hugo/RT

ヘロト 人間 ト 人 ヨ ト 人 ヨ ト

-31

Applying Hugo/RT in CCP

Model checking connnectors

- one-click"
- no model checking knowledge necessary

Correctness of (Static) Configurations

Theorem

Let Ξ_1 and Ξ_2 be port specifications. Let Γ be a configuration containing two component instances c_1 and c_2 , such that c_1 has a port instance p_1 satisfying Ξ_1 and c_2 has a port instance p_2 satisfying Ξ_2 and p_1 and p_2 are connected.

$$\Xi_1 \parallel \Xi_2 \models \neg \delta \quad \Rightarrow \quad \Gamma \models \neg \delta$$

A (B) > A (B) > A (B) >

Conclusions and Future Work

Architectural Programming with Java/A

- bridging the gap between software architecture and programming languages
- based on an algebraic component model

Future Work

- extensions: "explicit" ports of composite components, n-ary connectors, shared components, ...
- specification framework: for reconfigurations, internal component behavior, ...
- proof techniques (for refinements, ...)
- black box and glass box semantics

A (10) < A (10) < A (10) </p>
